Highly Configurable Systems

192 configurations

Apache

eclipse

ORACLE
BERKELEY DB **12^c**

2560 configurations

LLVM

1152 configurations

Performance Models and Their Properties

What is the performance of Config. 100?

3.14159265358979323846264338

Accuracy

Complexity

Compute time

Real-World Example

- **HSMGP** highly scalable multi-grid solver for large datasets
 - 32 configuration options
 - 3456 configurations
 - Performance = Solving time
- **Benchmarked all configurations**
- **Applied a configurable machine-learning algorithm to learn the influence of the configuration options on the system's performance**

HSMGP Performance Models

- **Model 1:**

$$\begin{aligned}
 &1898.97 \cdot \text{CGS} + 4579.98 \cdot \text{GSACBE} + 254.46 \cdot \text{GSRB} + -513.26 \cdot \text{GS} + -409.03 \cdot \text{GSAC} + 257.11 \cdot \text{numCores}_{4096} + \\
 &-166.14 \cdot \text{CGS_IP_AMG} + 1944.30 \cdot \text{GS_numPre}_0 \cdot \text{numPost}_1 + 1996.71 \cdot \text{numPre}_1 \cdot \text{numPost}_0 + \\
 &-4826.99 \cdot \text{GSACBE_numPre}_1 \cdot \text{numPost}_0 + 2326.29 \cdot \text{GSRB_numPre}_0 \cdot \text{numPost}_1 + -1674.72 \cdot \text{GSACBE_numPost}_1 + \\
 &1791.76 \cdot \text{GSACBE_numPre}_6 + 1170.06 \cdot \text{GSACBE_numPre}_5 + -1416.57 \cdot \text{GSRBAC_numPre}_1 \cdot \text{numPost}_0 + \\
 &2087.99 \cdot \text{JAC_numPre}_0 \cdot \text{numPost}_1 + 85.81 \cdot \text{numCores}_{1024} + -438.45 \cdot \text{GSRBAC_numPre}_1 + \\
 &-2497.00 \cdot \text{GSACBE_numPre}_0 \cdot \text{numPost}_2 + 363.91 \cdot \text{GSRBAC_numPost}_6 + -2918.50 \cdot \text{GSACBE_numPre}_2 \cdot \text{numPost}_0 + \\
 &-379.99 \cdot \text{GSRBAC_numPre}_2 + 478.58 \cdot \text{numPre}_2 \cdot \text{numPost}_0 + -1139.78 \cdot \text{GSAC_numPre}_1 \cdot \text{numPost}_0 + \\
 &232.59 \cdot \text{numPre}_6 \cdot \text{numPost}_6 + 689.11 \cdot \text{GS_numPre}_1 \cdot \text{numPost}_1 + 260.11 \cdot \text{GSRBAC_numPost}_5 + -233.95 \cdot \text{GSRBAC_numPre}_3 + \\
 &913.87 \cdot \text{GSRB_numPre}_1 \cdot \text{numPost}_1 + -95.52 \cdot \text{CGS_IP_CG_numCores}_{64} + 698.16 \cdot \text{GS_numPre}_0 \cdot \text{numPost}_2 + \\
 &-1971.52 \cdot \text{GSACBE_numPre}_2 \cdot \text{numPost}_2 + 879.54629303334 \cdot \text{GSRB_numPre}_0 \cdot \text{numPost}_2 + 811.11 \cdot \text{GSAC_numPre}_0 \cdot \text{numPost}_1 \\
 &+ -1865.21 \cdot \text{GSACBE_numPre}_1 \cdot \text{numPost}_2 + -1852.20 \cdot \text{GSACBE_numPre}_3 \cdot \text{numPost}_0 + 2259.25 \cdot \text{GSACBE_numPre}_0 \cdot \text{numPost}_6 \\
 &+ 2205.56 \cdot \text{GSACBE_numPre}_4 \cdot \text{numPost}_4 + 2204.54 \cdot \text{GSACBE_numPre}_3 \cdot \text{numPost}_5 + 2206.79 \cdot \text{GSACBE_numPre}_2 \cdot \text{numPost}_6
 \end{aligned}$$

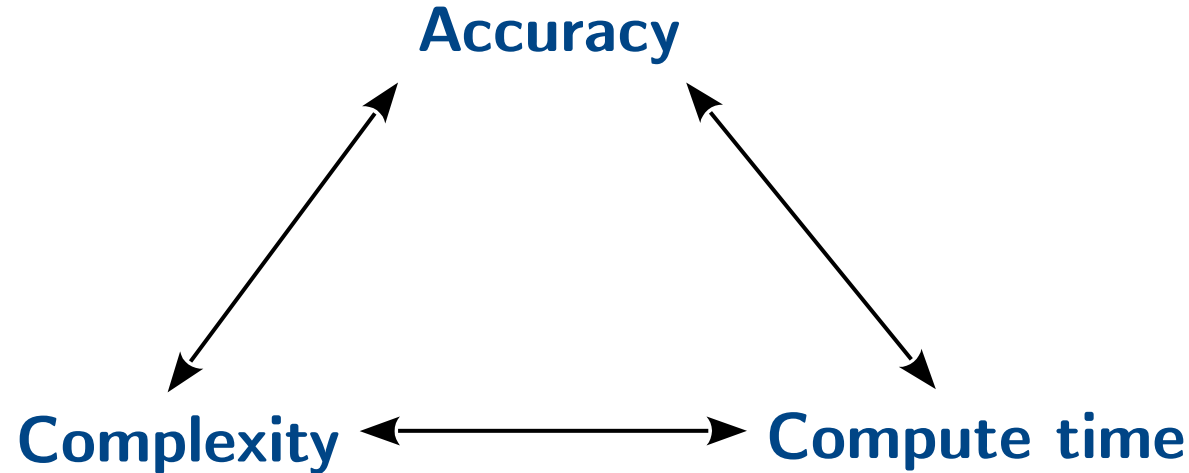

Error: 6%
Time: 25 days

- **Model 2:**

$$\begin{aligned}
 &1945.1 \cdot \text{CGS} + 4607.5 \cdot \text{GSACBE} + 364.5 \cdot \text{GSRB} \\
 &-458.3 \cdot \text{GS} - 391.6 \cdot \text{GSAC} + 239.1 \cdot \text{Cores} - 154.2 \cdot \text{CGSIP}
 \end{aligned}$$

Error: 13%
Time: 10 hours

What are the Tradeoffs?

- Adapted an **existing** linear regression **algorithm** to learn performance models
- Empirical study on **10 highly-configurable** real-world systems to quantify the tradeoffs

Example DBMS

Id	Config.	Perf.
1		100
2		90
3		70
4		100
5		80
6		90
7		70
8		80

stepwise
learning algorithm

Id	Config.	Perf.
1		100
2		90
3		70
4		100
5		80
6		90
7		70
8		80

Performance – write speed in MB/s

$$100 \cdot \text{database icon} - 10 \cdot \text{box icon} - 30 \cdot \text{lock icon}$$

Performance of configuration 2:

$$100 \cdot 1 - 10 \cdot 1 - 30 \cdot 0 = 90$$

Performance of configuration 5:

$$100 \cdot 1 - 10 \cdot 1 - 30 \cdot 1 = 60$$

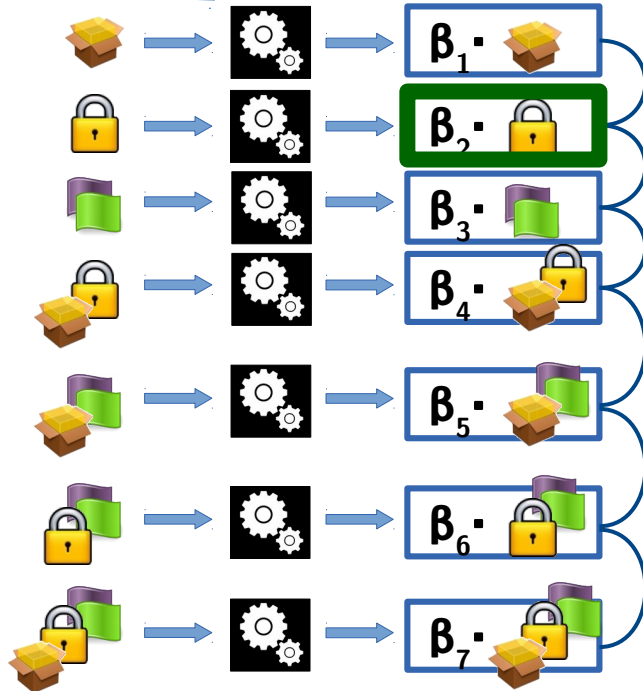

Stepwise Learning Algorithm

Id	Config.	Perf.
1		100
2		90
3		70
4		100
5		80
6		90
7		70
8		80

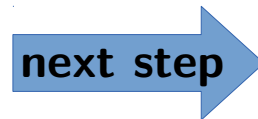

standard linear-regression algorithm

Id	Config.	Perf.
1		100
2		90
3		70
4		100
5		80
6		90
7		70
8		80

the highest accuracy gain

$$\beta_2 \cdot \text{lock}$$

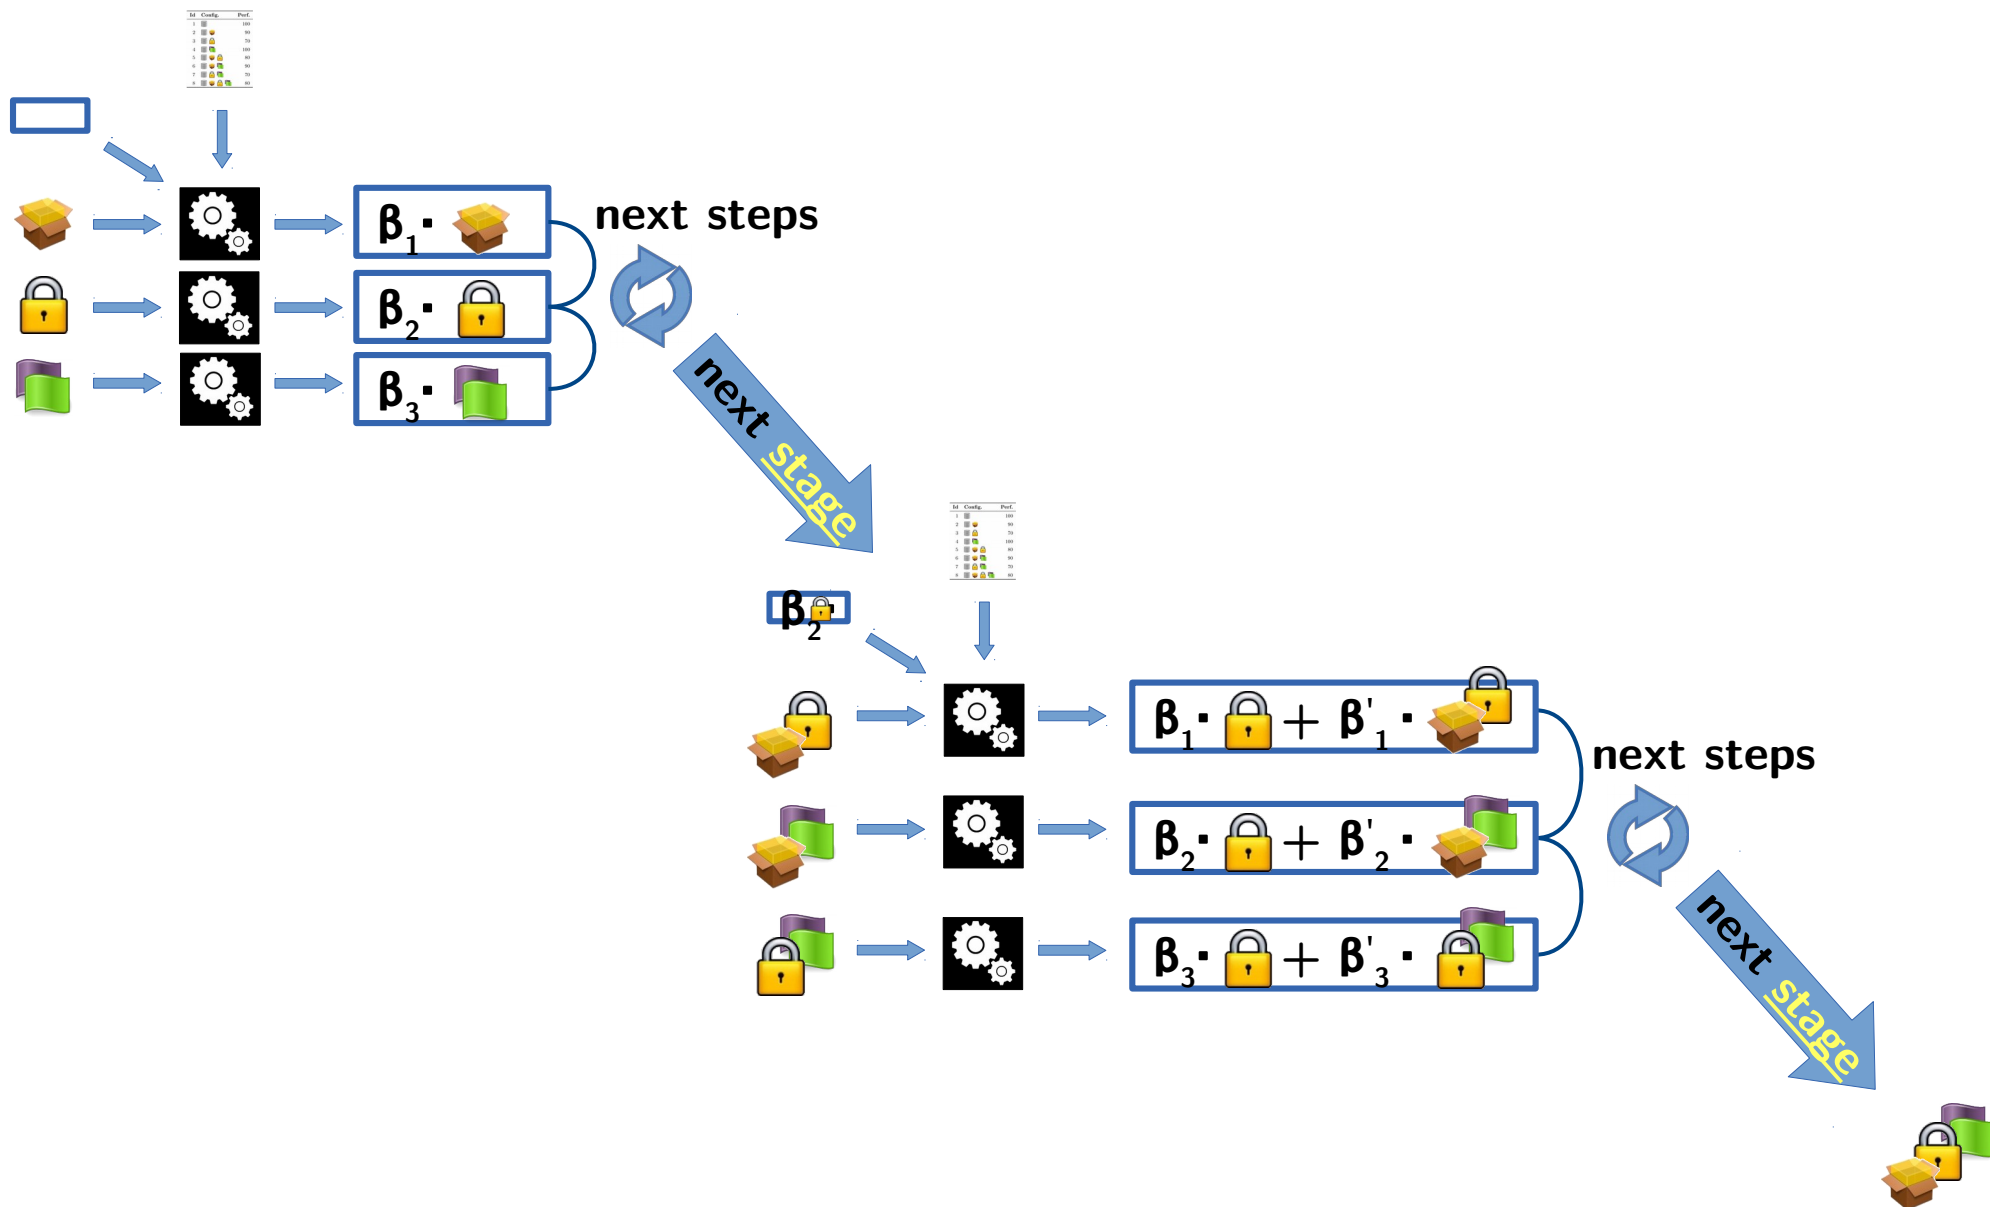

$$\beta_2 \cdot \text{lock} + \beta'_1 \cdot \text{stack of 4 boxes}$$

·
· · ·
·

Hierarchical Stepwise Learning Algorithm

Candidate-Size Penalty

$p()$ – size-penalty function

Gain

$Gain' = p(\text{Gain}, \text{Size})$

Algorithm Variants

- | | | |
|---------------------|------------|--------|
| 1. Non-hierarchical | no penalty | (nh) |
| 2. Non-hierarchical | penalty | (nh,p) |
| 3. Hierarchical | no penalty | (h) |
| 4. Hierarchical | penalty | (h,p) |

Subject Systems

System	Domain	$ O $	$ C $	Performance
AJSTATS	stat. analysis	20	30 256	analysis time
APACHE	web-server	9	192	response rate

Conclusion

- **Tradeoffs** among performance model accuracy, complexity, and compute time
- Empirical study on **10 highly-configurable real-world systems**
- **Low complexity and fast compute time with minor accuracy loss**
